LAB REPORT on

Machine Learning (20CS6PCMAL)

Submitted by

Kizhakel Sharat Prasad (1BM19CS074)

in partial fulfillment for the award of the degree of BACHELOR OF ENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING
(Autonomous Institution under VTU)
BENGALURU-560019

May-2022 to July-2022

B. M. S. College of Engineering, Bull Temple Road, Bangalore 560019

(Affiliated To Visvesvaraya Technological University, Belgaum)

Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled "Machine Learning" carried out by **Kizhakel Sharat Prasad (1BM19CS074)**, who is bonafide student of **B. M. S. College of Engineering.** It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2022. The Lab report has been approved as it satisfies the academic requirements in respect of a **Machine Learning (20CS6PCMAL)** work prescribed for the said degree.

Saritha A.N. Assistant Professor Department of CSE BMSCE, Bengaluru **Dr. Jyothi S Nayak**Professor and Head

Course Outcome

CO1	Ability to apply the different learning algorithms.
CO2	Ability to analyze the learning techniques for given dataset.
CO3	Ability to design a model using machine learning to solve a problem.
CO4	Ability to conduct practical experiments to solve problems using appropriate machine learning techniques

1. Implement and demonstrate the FIND-S algorithm for finding the most specific hypothesis based on a given set of training data samples.

```
import numpy as np
import pandas as pd
data = pd.read_csv("mydata.csv")
print(data,"\n")
d = np.array(data)[:,:-1]
print("\n The attributes are: ",d)
target = np.array(data)[:,-1]
print("\n The target is: ",target)
def findS(c,t):
  for i, val in enumerate(t):
    if val == "Yes":
      specific_hypothesis = c[i].copy()
      break
  for i, val in enumerate(c):
    if t[i] == "Yes":
      for x in range(len(specific hypothesis)):
        if val[x] != specific_hypothesis[x]:
           specific_hypothesis[x] = '?'
         else:
           pass
  return specific_hypothesis
print("\n The final hypothesis is:",findS(d,target))
```

Dataset:

```
Time Weather Temperature Company Humidity
                                           Wind Goes
0 Morning Sunny
                   Warm
                           Yes
                                     Mild
                                            Strong Yes
1 Evening Rainy
                  Cold
                        No No
                                     Mild
                                            Normal No
2 Morning Sunny Moderate
                           Yes
                                   Normal
                                            Normal Yes
                  Cold
3 Evening Sunny
                            Yes
                                    High
                                             Strong Yes
```

Output:

The final hypothesis is: ['?' 'Sunny' '?' 'Yes' '?' '?']

2. For a given set of training data examples stored in a .CSV file, implement and demonstrate the Candidate-Elimination algorithm to output a description of the set of all hypotheses consistent with the training examples.

```
import numpy as np
import pandas as pd
data=pd.DataFrame(data=pd.read_csv('data.csv'))
print(data)
concepts=np.array(data.iloc[:,0:-1])
print("The attributes are: ",concepts)
target=np.array(data.iloc[:,-1])
print ("\n The target is =",target)
def learn(concepts,target):
  specific_h=concepts[0].copy()
  print("\n Initialization of specfic_h and generalization")
  print(specific_h)
  general_h = [["?" for i in range(len(specific_h))] for i in range(len(specific_h))]
  print(general_h)
  for i,h in enumerate(concepts):
    print("For loop starts")
    if target[i] =="yes":
      print("If instance is positive")
      for x in range(len(specific_h)):
         if h[x]!=specific_h[x]:
           specific_h[x]='?'
           general h[x][x]='?'
    if target[i]=="no":
      print("If instance is negative ")
      for x in range(len(specific_h)):
        if h[x] !=specific_h[x]:
           general_h[x][x]=specific_h[x]
         else:
           general_h[x][x]='?'
    print("steps of candidate elimination algorithm",i+1)
    print(specific_h)
    print(general_h)
    print("\n")
    print("\n")
  indices=[i for i,val in enumerate(general_h) if val==['?','?','?']]
  for i in indices:
    general_h.remove(['?','?','?'])
  return specific_h,general_h
s_final, g_final = learn(concepts, target)
print("Final specific_h:",s_final,sep="\n")
print("Final General_h:",g_final,sep="\n")
```

Dataset:

	sky	air	temp	humidity	wind	water	forecast	enjoy	sport
0	sunny		warm	normal	strong	warm	same		yes
1	sunny		warm	high	strong	warm	same		yes
2	rainy		cold	high	strong	warm	change		no
3	sunny		warm	high	strong	cool	change		yes

3. Write a program to demonstrate the working of the decision tree based ID3 algorithm. Use an appropriate data set for building the decision tree and apply this knowledge to classify a new sample.

```

143	10	108	66	0	0	32.4	0.272	42	1
144	4	154	62	31	284	32.8	0.237	23	0

Confusion matrix
[[32 10]
[9 7]]

Accuracy of the classifier is 0.6724137931034483

The value of Precision 0.4117647058823529

The value of Recall 0.4375
Predicted Value for individual Test Data: [1]

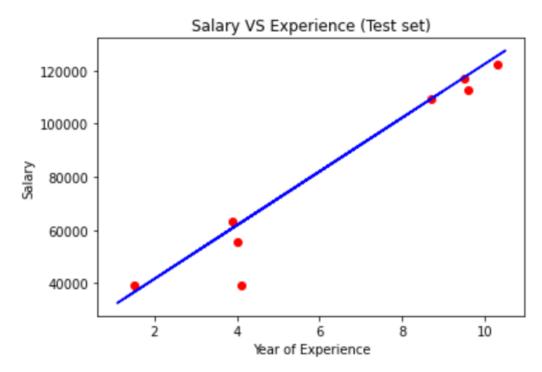

5. Implement the Linear Regression algorithm in order to fit data points. Select appropriate data set for your experiment and draw graphs

```
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd
dataset = pd.read_csv('salary_data.csv')
X = dataset.iloc[:, :-1].values
y = dataset.iloc[:, 1].values
from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=
# Fitting Simple Linear Regression to the Training set
from sklearn.linear_model import LinearRegression
regressor = LinearRegression()
regressor.fit(X_train, y_train)
# Predicting the Test set results
y_pred = regressor.predict(X_test)
# Visualizing the Training set results
viz train = plt
viz_train.scatter(X_train, y_train, color='red')
viz_train.plot(X_train, regressor.predict(X_train), color='blue')
viz_train.title('Salary VS Experience (Training set)')
viz_train.xlabel('Year of Experience')
viz_train.ylabel('Salary')
viz_train.show()
# Visualizing the Test set results
viz test = plt
viz_test.scatter(X_test, y_test, color='red')
viz_test.plot(X_train, regressor.predict(X_train), color='blue')
viz_test.title('Salary VS Experience (Test set)')
viz test.xlabel('Year of Experience')
viz_test.ylabel('Salary')
viz_test.show()
regressor.score(X_train,y_train)
print(regressor.score(X test,y test))
```
